

The Race Cask Ventilator

What a useful little device this is. Not only will it double the lifetime of a cask of Beer, it saves time, removing the need to run up and down those Cellar steps to replace the hard Pegs, and that's if you remembered to do it !!

Let the Race Cask Ventilator Take the strain and it will 'Nanny' Your Casks from start to Finish. How ?

Quite Simple Really, as All Good Invention are, The Race Cask Ventilator harnesses the Naturally produced CO2 created as the beer is conditioning and only allows the excess to escape to air, thus providing a natural blanket of CO2 to preserve the beer. The Only time air can enter the Cask is when the Handpull is active and the air Valve opens when it senses the pressure drop created. As soon as the beer Engine Handle is Closed, the Race Cask Ventilator shuts off the air.... Simple but Brilliant !!
Hopefully the Diagram below will help.
